

## FF6WC Randomizer Auto-Tracking setup on macOS

### Pre-requisites:

1. Download SNI: <https://github.com/alttpo/sni>
2. Download RetroArch from the App Store\* or from <https://www.retroarch.com>
3. Launch <https://tracker.ff6worldscollide.com/auto> in any non-Safari browser.

### Instructions:

1. Un-pack the SNI .tar file into a location of your choice.
2. Launch macOS System Settings -> General -> Login Items & Extensions.
3. Choose the + icon and locate the “sni” executable in the location you un-packed the .tar file. This will allow SNI to auto-start when you login to your Mac.
4. Launch the FF6 WC tracker in a non-Safari Browser \*\*
5. Launch RetroArch and navigate to Settings -> Network
6. At the bottom, make sure to set “Network Commands” to On.
7. Make sure to set the Network Command Port to “55355”.
8. Go back to Main Menu and choose Load Core.
9. Choose Load Core and choose “SNES9x 2010” \*\*\*.
10. Choose Load Content and load your game.

*\* RetroArch, when downloaded from the App Store, has a known bug due to the Sandboxing required for the App Store. This bug causes files located inside your User directory to be inaccessible by RetroArch. The workaround is to use Command+O and navigate to the ROM file **every time**. I recommend downloading RetroArch's macOS Universal .dmg from their website and using the Online Updater to update each component.*

*\*\* As of Safari 9.X, Safari does not allow “mixed requests” (see <https://support.apple.com/en-us/103498>). There is no way to disable this functionality so when the FF6 tracker calls localhost on the websocket port for SNI, it fails.*

*\*\*\* As of writing, Snes9x 2005, Snes9x, bsnes, bsnes-hd beta, and bsnes-jg cores DO NOT use READ\_CORE\_MEMORY and/or they do not support LUA/SNI.*
